Research Interests

My research centers on reliable multimodal intelligence in open and interactive environments: how AI systems keep object identity, world state, task-relevant evidence, and interaction context stable as tasks change, observations extend over time, and humans participate.

Open-World Vision	Perception and world-state modeling under occlusion, interference, and physical disturbance: object tracking, vision-language grounding, long-horizon visual memory, and reliable perception for UAVs and embodied systems
Multimodal Reasoning	Evidence-grounded reasoning in multimodal foundation models: evidence selection and verification in images and long videos, spatiotemporal and causal reasoning, streaming memory, and process-level verification for agents
Human-Centered Agents	Agents that model cognitive and learning states, capability boundaries, and social interaction, with education as the testbed: personalized agents, virtual students, multi-agent simulation, and human-AI collaboration

Across these directions I build open task spaces, human-grounded evaluation protocols, and process-level diagnostics that expose capability boundaries and failure mechanisms and feed them back into model design.
